

What each contribution establishes

C1 Admission contract

Preserves proposal and human value authority in one successor.

Exact candidate + authorized value
+ complete field-source lineage

C2 Conditional characterization

Shows which omissions hide each declared failure family.

Paired histories / Proposition 1
Within the declared observation model

C3 Realization checks

Checks the contract in a model and the persisted implementation.

Alloy, projections and fault tests
Bounded; implementation-specific

C4 Cost and agent observations

Characterizes cost and separates task behavior from host authority.

Persistence / trace / agent workloads
Fixed environment and restricted tools

C5 Evaluated-control separation

Value-audit and enriched-context controls isolate exact review linkage.

Distinct identities can remain equivalent under recorded review observations.

Reproducibility: raw records -> normalized inputs -> reported outputs
